APPENDICES

1.0 PURPOSE

This report has been prepared for FirstEnergy Generation, LLC (FirstEnergy) to document groundwater monitoring activities at the Little Blue Run Disposal Facility (LBR) conducted during the 2019 calendar year in accordance with 40 CFR § 257.90(e) of the HAZARDOUS AND SOLID WASTE MANAGEMENT SYSTEM; DISPOSAL OF COAL COMBUSTION RESIDUALS FROM ELECTRIC UTILITIES; FINAL RULE, 80 Fed. Reg. 21302 (issued Apr. 17, 2015 and amended August 29, 2018) ("CCR Rule"). By definition in 40 CFR §257.53, LBR is classified as an Existing CCR Surface Impoundment.

2.0 BACKGROUND

2.1 SITE DESCRIPTION AND HISTORY

LBR is an unlined coal-combustion residuals (CCR) surface impoundment located in Beaver County, Pennsylvania and Hancock County, West Virginia. LBR is formed behind an approximately 400-foot high earth- and rock-fill dam that spans the Little Blue Run valley, just south of the Ohio River. LBR has a permitted acreage of 965 acres with approximately 16 miles of shoreline surrounding the limits of disposal, and has an extensive groundwater monitoring network that has been in place for over 40 years. CCR disposal at LBR ceased on December 31, 2016, and the facility is currently undergoing an approximate 12-year closure process that involves covering the impoundment with an impermeable geo-membrane cap and soil cover. To date, approximately 271 acres have been capped in accordance with the approved April 2014 Residual Waste Permit (No. 300558; the "Permit") issued by the Pennsylvania Department of Environmental Protection (PADEP).

Groundwater assessments have been performed at LBR since the 1990s in accordance with Pennsylvania Residual Waste Regulations (25 Pa. Code §289.266). The current permitted monitoring program required by a December 2012 Consent Decree (CD) between FirstEnergy and the PADEP and the April 2014 Permit includes sampling and analysis of 87 groundwater monitoring wells, 18 former domestic wells, 27 current domestic wells, over 230 springs, and 42 surface water monitoring points. Presently, groundwater monitoring at these locations includes quarterly sampling and analysis for 26 total & dissolved metals, and 13 inorganic/indicator parameters.

In addition to the permitted monitoring program, 77 additional monitoring wells were installed between 2014 and 2017 as part of six groundwater assessments at the facility performed in accordance with 25 Pa. Code §289.266. FirstEnergy continues to voluntarily sample a subset of these wells on a quarterly basis to further assess groundwater quality at LBR.

Groundwater monitoring in accordance with the CCR Rule commenced in 2016. The CCR Rule Groundwater Monitoring System includes a subset of the existing PADEP-permitted groundwater monitoring network and currently consists of 47 monitoring wells and 20 springs. In 2019, assessment monitoring performed in accordance with the CCR Rule determined that Appendix IV constituents (arsenic and lithium) are present in groundwater at LBR at Statistically Significant Levels (SSLs) above the Groundwater Protection Standards (GWPSs). As such, an Assessment of Corrective Measures has been performed in accordance with 40 CFR § 257.96.

2.2 TOPOGRAPHY AND DRAINAGE

The Little Blue Run valley is a deeply-dissected residual upland. The area is dominated by steep slopes (up to 70%), with flat-lying areas occurring along stream floodplains and in upland areas between streams.

Prior to construction of LBR, the area was drained by Little Blue Run, which flows northward to the Ohio River. Surrounding watersheds are drained by Mill Creek to the east and Marks Run and its tributaries to the west, both of which flow to the Ohio River.

Erosion by Mill Creek and Little Blue Run has produced a narrow, north-trending ridge on the east side of LBR. Erosion by Marks Run and a western tributary of Little Blue Run has produced a similar narrow ridge on the west side of LBR.

Drainage to most of the Little Blue Run watershed collects in LBR, where the water level behind the dam is controlled by the supernatant river-return system. This system consists of an 18-inch lined borehole (secondary spillway) through the right dam abutment that discharges by gravity to a stilling basin just north of the dam. Both a primary spillway and an emergency spillway are located on the left dam abutment. These spillways are designed to handle design storms beyond the capacity of the secondary spillway. Ultimately, water discharged from LBR is conveyed through a concrete pipe at the downstream end of the stilling basin that discharges to the Ohio River through permitted NPDES Outfall 022.

Flow in the lower reaches of the Little Blue Run stream located north (downstream) of the dam is maintained by drainage from the dam abutments.

2.3 GEOLOGY

LBR is located in the Allegheny Plateau physiographic province, which is characterized by gently dipping coal measures of complex stratigraphy. The stratigraphic units relevant to LBR are Pennsylvanian in age, and belong to the Conemaugh, Allegheny, and Pottsville Groups (Figure 1). The bedrock lithologies surrounding LBR include sandstone, siltstone, claystone, shale, limestone, and coal.

Bedrock within the permit area of LBR is overlain by as much as 24 feet of residuum consisting of residual clay, silt, sand, and weathered rock. Alluvium in the Little Blue Run stream valley is composed of clayey sand and gravel up to 30 feet thick.

2.4 HYDROGEOLOGY

2.4.1 Aquifers

Seven informal aquifers have been defined in the vicinity of LBR on the basis of stratigraphy (Figure 1). These units are not highly permeable, but are more permeable than other units in the stratigraphic series. The permeable strata, generally sandstones and coals, act as aquifers which more readily transmit groundwater. The less-permeable strata, such as shales, claystones, and siltstones, act as aquitards that restrict flow. Both types of units transmit water mainly by secondary, or fracture, permeability.

Tectonic and stress-relief fracturing and weathering have combined to modify the stratigraphic control on permeability by creating a more permeable "rind" over the surfaces of the hills. Any given stratum typically has its lowest permeability beneath the crest of a hill, and permeability increases as the unit approaches its cropline.

Unconsolidated regolith and alluvium probably constitute the most permeable geologic materials at the site. However, they are generally not saturated except in valley bottoms or in the vicinity of springs. These materials are not considered aquifers in the conceptual site model because they are not horizontally pervasive over the site, however, they have been considered as areas of higher permeability at the edges of the aquifers described below.

Middle Glenshaw Aquifer: The Middle Glenshaw aquifer, the highest bedrock aquifer in the section, includes the Brush Creek coal, upper Mahoning sandstone, and the Mahoning coal. The Mahoning sandstone and Mahoning coal are separated by less permeable rocks. The unit has been removed from most of the site by erosion, but crops out on the hillsides surrounding LBR at approximate elevations between 1010 and 1070 ft above mean seal level (AMSL).

Lower Glenshaw Aquifer: The next aquifer beneath the Middle Glenshaw is the Lower Glenshaw aquifer. The aquifer is composed of the Lower Mahoning sandstone, the Upper Freeport coal, and less permeable rocks. This aquifer is present between approximate elevations 920 and 1010 ft AMSL. It crops out north and east of LBR, as well as within the impoundment, and in the Lawrenceville, West Virginia area west of the impoundment.

Freeport Aquifer: Below the Lower Glenshaw aquifer is the Freeport aquifer, which includes the section below the Upper Freeport coal down to the Upper Kittanning coal. The Freeport sandstone and Lower Freeport coal are also contained within this section, as are less permeable rocks. The Freeport aquifer occurs at approximate elevations of 830 to 920 ft AMSL. The Freeport crops out at the northern and northeastern edge of the area, within the incised valleys north and northwest of the impoundment and within the impoundment.

Worthington Aquifer: The Worthington aquifer occurs between approximate elevations of 740 to 830 feet AMSL and includes the section below the Upper Kittanning coal to the Kittanning sandstone. This part of the section includes the upper Worthington sandstone, the middle Kittanning coal, the Lower Worthington sandstone, and the Lower Kittanning coal, as well as less

permeable rocks. The unit crops out along the Ohio River and in the lower reaches of the Little Blue Run valley, Mill Creek valley and the valleys northwest of the impoundment.

Kittanning Aquifer: The Kittanning aquifer occurs between approximate elevations of 660 to 740 feet AMSL, and is composed of the Kittanning sandstone unit and less permeable rock.

Clarion Aquifer: The Clarion aquifer lies below the Kittanning interval between approximate elevations of 600 to 660 feet AMSL and is composed of the Clarion coal, Clarion Sandstone, Brookville coal, and less permeable rock between these more permeable units.

Homewood Aquifer: The Homewood aquifer is the lowest aquifer present in the interval investigated by drilling. It is composed of the Homewood sandstone, and its upper limit occurs at approximate elevation 600 feet AMSL.

2.4.2 Groundwater Flow Characteristics

Groundwater flow: Groundwater table or potentiometric surface maps for various aquifers are shown on Drawings 1 and 2. Drawing 1 was developed using groundwater elevations in monitoring wells that are screened near or just below the water table and using the locations of springs to approximate where the water table intersects the ground surface. Because of the overall size (approximately 7 mi^2) and complex nature of the Site, and the fact that water levels obtained during monitoring events are collected over a number of months due to the large number of sample locations; annual high groundwater levels were used to create the water table contour lines shown on Drawing 1. As these drawings show, groundwater flow patterns at LBR are a complex, three-dimensional field because of the high relief and complex stratigraphy of the area. The flow regime in each aquifer depends upon its elevation with respect to its outcrop locations and the CCR elevation within LBR.

Groundwater flow patterns in the shallow aquifers which crop out above local drainage in the valleys of Mill Creek and Little Blue Run (Middle Glenshaw, Lower Glenshaw, Freeport and Worthington)

are strongly controlled by local topography. In the upper portions of the drainage basin, south of the impoundment, these aquifers are recharged by precipitation and leakage from overlying aquifers. In this area, the lateral component of groundwater flow is northward, toward and into the impoundment.

In the lower reaches of the drainage basin (northeast, northwest and north of LBR), these shallow aquifers crop out in the Mill Creek and Little Blue Run valleys, the valleys northwest of LBR, and along the Ohio River. Hydraulic heads in almost all of the wells in this area are below the impoundment level. Thus, the impoundment recharges the groundwater system in these areas and groundwater flows from LBR toward discharge locations at the aquifer outcrops.

Groundwater flow patterns in the intermediate aquifers that occur at or slightly below the level of Mill Creek and Little Blue Run (Kittanning and Clarion) reflect regional flow components. Flow in these aquifers is primarily northward toward the Ohio River over most of the area, with a component toward Mill Creek in its lower reaches.

Groundwater flow patterns in the deep Homewood aquifer have not been extensively investigated. However, it is expected that groundwater in this unit reflects regional flow components (i.e. toward the Ohio River).

Groundwater velocities: Groundwater velocities in the vicinity of LBR vary greatly because of the wide variety of physical properties within aquifers and the varying hydraulic gradients. Typically, the upland recharge areas south of the impoundment have very low hydraulic gradients; therefore, lower velocities prevail in these areas. In areas further north, particularly in the narrow ridge between LBR and Mill Creek, high gradients produced by impounded water in LBR can result in higher velocities.

Numerical groundwater flow modeling showed that groundwater velocities also vary by aquifer. Typically, the deeper aquifers have much lower velocities than aquifers near the surface, mainly due to greater secondary permeability in the shallower aquifers. Groundwater velocities ranged from $4x10^{-6}$ to $1x10^{-4}$ ft/day in deeper aquifers, and from 0.02 to 0.8 ft/day in unfractured zones

within shallower aquifers. Greater velocities occur in bedrock fracture zones where secondary permeability is orders of magnitude greater than in the bulk rock mass. Bedrock fracture zones have modelled flow velocities that range from approximately 0.76 to 10 ft/day. The weathered zones at the edges of the aquifers also show greater velocities resulting from increased secondary permeability.

3.0 KEY ACTIVITIES COMPLETED

3.1 KEY ACTIVITIES COMPLETED PRIOR TO THE 2019 CALENDAR YEAR

3.1.1 Groundwater Monitoring System and Statistical Method

In accordance with 40 CFR § 257.91 and § 257.93, a groundwater monitoring system and groundwater statistical method of evaluation were developed for LBR and certified in October 2017 by a licensed professional engineer.

3.1.2 Background and Detection Monitoring

In accordance with 40 CFR § 257.94(b), FirstEnergy collected eight independent samples from each background and downgradient monitoring point for analysis of the constituents listed in Appendix III and IV of the CCR Rule. Groundwater samples were collected from January 2016 through October 17, 2017.

In accordance with 40 CFR § 257.94(a), FirstEnergy collected detection monitoring samples from each monitoring point for analysis of the constituents listed in Appendix III of the CCR Rule. The detection monitoring samples were collected in the 4th Quarter 2017.

3.1.3 Statistical Evaluation of Detection Monitoring Data

In accordance with 40 CFR § 257.90 and § 257.93, FirstEnergy evaluated the detection monitoring data for a statistically significant increase (SSI) above the background level for each constituent listed in Appendix III of the CCR Rule. In accordance with 40 CFR §257.93 (h)(2), the SSI determination was completed within 90 days of completing the detection monitoring sampling and laboratory analyses.

3.1.4 Establishment of Assessment Monitoring Program

As a result of SSIs found during Detection Monitoring and in accordance with 40 CFR § 257.95, FirstEnergy established an Assessment Monitoring Program and began sampling and analyzing the monitoring points in the CCR Rule Groundwater Monitoring System for Appendix IV constituents.

3.1.5 Establishment of Groundwater Protection Standards

In accordance with 40 CFR § 257.95(d)(2), FirstEnergy established GWPSs for detected Appendix IV constituents.

3.1.6 Statistical Evaluation of Assessment Monitoring Data

In accordance with 40 CFR § 257.93, FirstEnergy evaluated the assessment monitoring data for SSLs above the GWPSs for each constituent listed in Appendix IV of the CCR Rule. As discussed in greater detail in FirstEnergy's 2018 Annual Groundwater Monitoring and Corrective Action Report, the evaluation identified arsenic and lithium at SSLs greater than GWPSs in one or more aquifer.

3.2 KEY ACTIVITIES COMPLETED DURING THE 2019 CALENDAR YEAR

3.2.1 Characterization of Nature and Extent of Release

In accordance with 40 CFR § 257.95(g)(1) and after making the determination that arsenic and lithium are present at SSLs above the GWPSs, FirstEnergy characterized the extent of SSLs for arsenic and lithium in groundwater at LBR by adding an additional 10 monitoring points to the CCR Rule Groundwater Monitoring System and sampling and analyzing them for Appendix III and IV constituents.

3.2.2 Assessment of Corrective Measures

Within 90 days of determining that arsenic and lithium are present at SSLs above GWPSs, an Assessment of Corrective Measures (ACM) was initiated in accordance with 40 CFR § 257.96 of the CCR Rule. FirstEnergy made a determination that completion of the ACM would require more than 90 days as specified in 40 CFR § 257.96(a); therefore, FirstEnergy made a demonstration of the need for additional time to complete the ACM. Copies of FirstEnergy's demonstration and the professional engineer certification are provided in Appendix A. The results of FirstEnergy's ACM were documented in the Coal Combustion Residuals Rule Assessment of Corrective Measures Report dated June 12, 2019.

4.0 CCR RULE GROUNDWATER MONITORING PROGRAM

Under the CCR Rule, CCR surface impoundments must have a groundwater monitoring system that consists of a sufficient number of wells, installed at appropriate locations and depths, to yield groundwater samples from the uppermost aquifer that:

- Accurately represent the quality of background groundwater that has not been affected by leakage from a CCR unit; and
- Accurately represent the quality of groundwater passing the waste boundary of the CCR unit. The downgradient monitoring system must be installed at the waste boundary to ensure detection of groundwater contamination in the uppermost aquifer. All potential contaminant pathways must be monitored.

The uppermost aquifer, by CCR Rule definition, includes lower aquifers that are hydraulically connected within the facility's property boundary.

4.1 CCR RULE GROUNDWATER MONITORING SYSTEM

The CCR Rule Groundwater Monitoring System (Groundwater Monitoring System) includes a subset of the existing PADEP-permitted groundwater monitoring network and currently consists of 47 monitoring wells and 20 springs, including 10 monitoring points that were added in 2019 to assess the extent of arsenic and lithium SSLs at LBR. Springs were included in the Groundwater Monitoring System to supplement data from the monitoring well network because they are an important aspect of LBR's monitoring program.

The Groundwater Monitoring System includes monitoring points within each of the six aquifers characterized at LBR. The Middle Glenshaw, Lower Glenshaw, Freeport, and Worthington aquifers are in contact with the CCR within LBR. The deeper Kittanning and Clarion aquifers do not crop out within the original Little Blue Run valley, and are not in contact with the CCR. However, monitoring wells located within these deeper aquifers have been included in the

Groundwater Monitoring System because of their potential connection with shallower aquifers. Monitoring points included in the Groundwater Monitoring System are presented in Table 1. Additional information on each monitoring point is provided in Table 2. The location of each monitoring point is shown on Drawing 3.

Monitoring points located downgradient of LBR that do not display impacts from LBR are representative of background water quality and may be included in the background data set. These locations also serve as assessment monitoring points for potential impacts.

4.2 GROUNDWATER SAMPLING AND ANALYSIS

Groundwater samples collected from each monitoring point in 2019 were analyzed for the parameters listed in Appendix III and IV of the CCR Rule. Turbidity, total alkalinity, magnesium, potassium and sodium were also included in the monitoring program. Turbidity was added to allow for an evaluation regarding the potential effect of turbidity on total metals results. The remaining constituents were added to the monitoring program so that Piper diagrams could be prepared to assess groundwater quality based on major ion chemistry. Table 3 provides a summary of the analytical parameters that are monitored at the site.

4.3 CCR RULE GROUNDWATER MONITORING PROGRAM STATUS

LBR has been in the Assessment Monitoring program since January 15, 2018.

4.4 CHANGES TO THE GROUNDWATER MONITORING SYSTEM

In the January 2018 Annual Groundwater Monitoring and Corrective Action Report, it was reported that background monitoring well MW-33D was removed from the CCR Rule Groundwater Monitoring System because the wellscreen and pump were damaged. In 2019, it was determined that the well is still serviceable. As such, the well has been reincorporated into the CCR Rule Groundwater Monitoring System. In addition, the following monitoring points were added to the CCR Rule Groundwater Monitoring System in 2019 to assess the extent of arsenic

and lithium SSLs in groundwater at LBR: MW-17A, MW-49B, S-1VI, S-4PC, S-17, S-19F, S-19I, S-25A, S-78 and First Valley Landslide.

5.0 CCR RULE 2019 ASSESSMENT MONITORING

Statistical evaluation of groundwater data performed in accordance with 40 CFR § 257.93 has identified the presence of SSIs of Appendix III parameters above background levels in each of the aquifers monitored at LBR as indicated in the following table. As a result, LBR has been in the Assessment Monitoring program since January 15, 2018.

App. III Constituent	Aquifer					
	Middle Glenshaw	Lower Glenshaw	Freeport	Worthington	Kittanning	Clarion
B, total (mg/L)	X	X	X	X	X	X
Ca, total (mg/L)	X	X	X	X		
Cl, total (mg/L)	X	X		X		
F, total (mg/L)						
pH (field, S.U.)						
SO_4 (mg/L)	X	X	X	X	X	X
TDS (mg/L)	X	X	X	X		

X – Indicates a SSI exists

5.1 SUMMARY OF 2019 GROUNDWATER SAMPLE COLLECTION

Three Assessment Monitoring events were conducted in 2019. The first sampling event was performed during the 1st Quarter 2019, and consisted of sampling the 10 new monitoring locations that were used to further characterize the extent of SSLs for arsenic and lithium. The two remaining events were performed during the 2nd and 4th Quarter 2019 to satisfy the requirement for semi-annual monitoring, and included sampling of the CCR Rule Groundwater Monitoring System for Appendix III and IV constituents, with a few exceptions as noted in Section 5.2. In accordance with 40 CFR § 257.90(e), a summary of groundwater sampling events performed in 2019 to satisfy the assessment monitoring requirements of the CCR Rule is presented in Table 4.

5.2 SUMMARY OF PROBLEMS ENCOUNTERED AND PROBLEM RESOLUTION

The following problems were encountered during monitoring events performed in 2019:

- S-1VE: This spring was dry in the 4th quarter 2019 and could not be sampled.
- S-81: This spring was dry throughout 2019 and could not be sampled.
- MW-16C: During the 4th Quarter, the well went dry during purging, and did not recover sufficiently to obtain a sample in a manner consistent with the sampling protocols for the site.

The absence of samples/data noted above has not impeded the performance of assessment monitoring activities at LBR; therefore, no additional action is warranted at this time.

5.3 ANALYTICAL DATA SUMMARY

Groundwater monitoring data from assessment monitoring samples collected in 2019 are provided in Appendix B.

6.0 GROUNDWATER PROTECTION STANDARDS FOR APPENDIX IV CONSTITUENTS

The groundwater protection standards (GWPS) for each Appendix IV constituent are established in accordance with 40 CFR § 257.95(h) as one of the following:

- For constituents with an established maximum contaminant level (MCL), the MCL for that constituent.
- For the following constituents, the following health-based values may be used:
    - Cobalt 0.006 mg/L,
    - Lead 0.015 mg/L,
    - Lithium 0.040 mg/L, and
    - Molybdenum 0.10 mg/L.
- For constituents for which the background concentration is greater than the MCL or the health-based concentrations listed above, the background concentration for that constituent.

As listed above, EPA developed specific health-based values for each of the four constituents in Appendix IV that do not have an MCL (cobalt, lead, lithium, and molybdenum). The health-based level for each of these four constituents was derived using the Regional Screening Level (RSL) for each constituent.

7.0 STATISTICAL EVALUATIONS OF APPENDIX IV CONSTITUENTS

For each aquifer, the Electric Power Research Institute's (EPRI) Groundwater Data Management and Evaluation Software (Manages Version 4.1) was used to calculate a background value for Appendix IV constituents based on pooled data from 2016 through 2017 at background monitoring points. The GWPS for each Appendix IV constituent was then set as the greater of the background value or the MCL/RSL. Water quality data collected from the assessment monitoring points through 2019 were then compared to the GWPS using the following methods in accordance with the USEPA Unified Guidance:

Comparison for MCL/RSL-based GWPS			
Data Distribution	***Non-Detect Frequency***	***Trend***	***Method***
Normal	≤50%	Stable	Confidence interval around normal mean
Lognormal	≤50%	Stable	Confidence interval around lognormal geometric mean
Non-normal	n/a	Stable	Non-parametric confidence interval around median
Cannot be determined	>50%	Stable	
Residuals after subtracting trend are normal	≤50%	Trend	Confidence band around linear regression
Residuals are not normal	≤50%	Trend	Confidence band around Theil-Sen line
Comparison for Background-based GWPS			
Single sample approach, where GWPS is based on tolerance interval and data is evaluated using confidence intervals			

The statistical analyses for each aquifer are summarized in the sections below.

7.1 MIDDLE GLENSHAW AQUIFER

7.1.1 Groundwater Protection Standards

As discussed in greater detail in the 2018 CCR Rule Annual Groundwater Monitoring and Corrective Action Report, water quality data from monitoring points MW-25, MW-30A, MW-111 and S-1VA collected in 2016 and 2017 were utilized to calculate background concentrations of

Appendix IV constituents in the Middle Glenshaw aquifer. The calculated background values were compared to the MCL or RSL, and the greater of the background value or MCL/RSL was selected as the GWPS. The GWPSs for Appendix IV constituents in the Middle Glenshaw aquifer are summarized below.

Middle Glenshaw Aquifer

App. IV Constituent	GWPS (mg/L)	Basis		App. IV Constituent	GWPS (mg/L)	Basis
Antimony	0.006	MCL		Lead	0.015	RSL
Arsenic	0.01	MCL		Lithium	0.04	RSL
Barium	2.0	MCL		Mercury	0.002	MCL
Beryllium	0.004	MCL		Molybdenum	0.10	RSL
Cadmium	0.005	MCL		Selenium	0.05	MCL
Chromium	0.10	MCL		Thallium	0.002	MCL
Cobalt	0.006	RSL		Radium-226+228	5.0	MCL
Fluoride	4.0	MCL				

7.1.2 Statistically Significant Levels

Concentrations of Appendix IV constituents from downgradient monitoring points in the Middle Glenshaw aquifer collected through 2019 were compared to GWPSs. The statistical analyses used for this comparison are included in the Manages 4.1 output files presented in Appendix C. The following SSL greater than the GWPS was identified in the Middle Glenshaw aquifer:

App. IV Constituent	Location(s)	Comparison Value (mg/L)	GWPS (mg/L)
Lithium	S-19E	Lower Confidence Limit 0.075	0.04

7.2 LOWER GLENSHAW AQUIFER

7.2.1 Groundwater Protection Standards

As discussed in greater detail in the 2018 CCR Rule Annual Groundwater Monitoring and Corrective Action Report, water quality data from monitoring points MW-6, MW-11B and MW-30B collected in 2016 and 2017 were utilized to calculate background concentrations of Appendix IV constituents in the Lower Glenshaw aquifer. The calculated background values were compared to the MCL or RSL, and the greater of the background value or MCL/RSL was selected as the GWPS. The GWPSs for Appendix IV constituents in the Lower Glenshaw aquifer are summarized below.

Lower Glenshaw Aquifer

App. IV Constituent	GWPS (mg/L)	Basis		App. IV Constituent	GWPS (mg/L)	Basis
Antimony	0.006	MCL		Lead	0.015	RSL
Arsenic	0.01	MCL		Lithium	0.04	RSL
Barium	2.0	MCL		Mercury	0.002	MCL
Beryllium	0.004	MCL		Molybdenum	0.10	RSL
Cadmium	0.005	MCL		Selenium	0.05	MCL
Chromium	0.10	MCL		Thallium	0.002	MCL
Cobalt	0.006	RSL		Radium-226+228	5.0	MCL
Fluoride	4.0	MCL				

7.2.2 Statistically Significant Levels

Concentrations of Appendix IV constituents from downgradient monitoring points in the Lower Glenshaw aquifer collected through 2019 were compared to GWPSs. The statistical analyses used for this comparison are included in the Manages 4.1 output files in Appendix D. The following SSLs greater than the GWPSs were identified in the Lower Glenshaw aquifer:

App. IV Constituent	Location(s)	Comparison Value (mg/L)	GWPS (mg/L)
Arsenic	MW-16A	Lower Confident Limit 0.028	0.01
	S-17	Lower Confident Limit 0.041	
Lithium	MW-9BR	Lower Confidence Limit 0.043	0.04
	MW-16A	Lower Confidence Limit 0.25	
	MW-12B	Lower Confidence Limit 0.069	
	MW-17A	Lower Confidence Limit 0.07	
	S-17	Lower Confidence Limit 0.16	
	S-19F	Lower Confidence Limit 0.055	

7.3 FREEPORT AQUIFER

7.3.1 Groundwater Protection Standards

As discussed in greater detail in the 2018 CCR Rule Annual Groundwater Monitoring and Corrective Action Report, water quality data from monitoring points MW-11A, MW-30C, MW-4AR, MW-7A, MW-14BR, MW-16B and MW-33A collected in 2016 and 2017 were utilized to calculate background concentrations of Appendix IV constituents in the Freeport aquifer. The calculated background values were compared to the MCL or RSL, and the greater of the background value or MCL/RSL was selected as the GWPS. The GWPSs for Appendix IV constituents in the Freeport aquifer are summarized below.

Freeport Aquifer

App. IV Constituent	GWPS (mg/L)	Basis		App. IV Constituent	GWPS (mg/L)	Basis
Antimony	0.006	MCL		Lead	0.015	RSL
Arsenic	0.01	MCL		Lithium	0.061	NPPI
Barium	2.0	MCL		Mercury	0.002	MCL
Beryllium	0.004	MCL		Molybdenum	0.10	RSL
Cadmium	0.005	MCL		Selenium	0.05	MCL
Chromium	0.10	MCL		Thallium	0.002	MCL
Cobalt	0.006	RSL		Radium-226+228	6.13	PARATI
Fluoride	4.0	MCL		NPPI = Non-parametric prediction interval PARATI = Parametric Tolerance Interval		

7.3.2 Statistically Significant Levels

Concentrations of Appendix IV constituents from downgradient monitoring points in the Freeport aquifer collected through 2019 were compared to GWPSs. The statistical analyses for this comparison are included in the Manages 4.1 output files presented in Appendix E. The following SSLs greater than the GWPSs were identified in the Freeport aquifer:

App. IV Constituent	Location(s)	Comparison Value (mg/L)	GWPS (mg/L)
Lithium	S-4PA	Median 0.097	0.061
	S-85	Median 0.30	

7.4 WORTHINGTON AQUIFER

7.4.1 Groundwater Protection Standards

As discussed in greater detail in the 2018 CCR Rule Annual Groundwater Monitoring and Corrective Action Report, water quality data from monitoring points MW-30D and MW-21B collected in 2016 and 2017 were utilized to calculate background concentrations of Appendix IV

constituents in the Worthington aquifer. The calculated background values were compared to the MCL or RSL, and the greater of the background value or MCL/RSL was selected as the GWPS. The GWPSs for Appendix IV constituents in the Worthington aquifer are summarized below.

Worthington Aquifer

App. IV Constituent	GWPS (mg/L)	Basis		App. IV Constituent	GWPS (mg/L)	Basis
Antimony	0.006	MCL		Lead	0.015	RSL
Arsenic	0.01	MCL		Lithium	0.04	RSL
Barium	2.0	MCL		Mercury	0.002	MCL
Beryllium	0.004	MCL		Molybdenum	0.10	RSL
Cadmium	0.005	MCL		Selenium	0.05	MCL
Chromium	0.10	MCL		Thallium	0.002	MCL
Cobalt	0.006	RSL		Radium-226+228	5.0	MCL
Fluoride	4.0	MCL				

7.4.2 Statistically Significant Levels

Concentrations of Appendix IV constituents from downgradient monitoring points in the Worthington aquifer collected through 2019 were compared to GWPSs. The statistical analyses used for this comparison are included in the Manages 4.1 output files presented in Appendix F. The following SSLs greater than the GWPSs were identified in the Worthington aquifer:

App. IV Constituent	Location(s)	Comparison Value (mg/L)	GWPS (mg/L)
Lithium	S-16D	Lower Confidence Limit 0.051	0.04
	S-81	Lower Confidence Limit 0.046	
	S-84	Lower Confidence Limit 0.31	

7.5 KITTANNING AQUIFER

7.5.1 Groundwater Protection Standards

As discussed in greater detail in the 2018 CCR Rule Annual Groundwater Monitoring and Corrective Action Report, water quality data from monitoring points MW-30E, MW-33C and MW-16C collected in 2016 and 2017 were utilized to calculate background concentrations for Appendix IV constituents in the Kittanning aquifer. The calculated background values were compared to the MCL or RSL, and the greater of the background value or MCL/RSL was selected as the GWPS. The GWPSs for Appendix IV constituents in the Kittanning aquifer are summarized below.

Kittanning Aquifer

App. IV Constituent	GWPS (mg/L)	Basis		App. IV Constituent	GWPS (mg/L)	Basis
Antimony	0.006	MCL		Lead	0.015	RSL
Arsenic	0.02	PARATI		Lithium	0.13	NPPI
Barium	7.0	NPPI		Mercury	0.002	MCL
Beryllium	0.004	MCL		Molybdenum	0.10	RSL
Cadmium	0.005	MCL		Selenium	0.05	MCL
Chromium	0.10	MCL		Thallium	0.002	MCL
Cobalt	0.006	RSL		Radium-226+228	49	NPPI
Fluoride	22	PARATI		NPPI = Non-parametric prediction interval PARATI = Parametric Tolerance Interval		

7.5.2 Statistically Significant Levels

Concentrations of Appendix IV constituents from downgradient monitoring points in the Kittanning aquifer collected through 2019 were compared to GWPSs. The statistical analyses for this comparison are included in the Manages 4.1 output files presented in Appendix G. No Appendix IV constituent was identified at a SSL greater than the GWPS in the Kittanning aquifer.

7.6 CLARION AQUIFER

7.6.1 Groundwater Protection Standards

As discussed in greater detail in the 2018 CCR Rule Annual Groundwater Monitoring and Corrective Action Report, water quality data from monitoring points MW-33D and MW-23B collected in 2016 and 2017 were utilized to calculate background concentrations of Appendix IV constituents in the Clarion aquifer. The calculated background values were compared to the MCL or RSL, and the greater of the background value or MCL/RSL was selected as the GWPS. The GWPSs for Appendix IV constituents in the Clarion aquifer are summarized below.

Clarion Aquifer

App. IV Constituent	GWPS (mg/L)	Basis		App. IV Constituent	GWPS (mg/L)	Basis
Antimony	0.006	MCL		Lead	0.015	RSL
Arsenic	0.01	MCL		Lithium	0.30	PARATI
Barium	36	PARATI		Mercury	0.002	MCL
Beryllium	0.004	MCL		Molybdenum	0.10	RSL
Cadmium	0.005	MCL		Selenium	0.05	MCL
Chromium	0.10	MCL		Thallium	0.002	MCL
Cobalt	0.006	RSL		Radium-226+228	100	PARATI
Fluoride	4.0	MCL		PARATI = Parametric Tolerance Interval		

7.6.2 Statistically Significant Levels

Concentrations of Appendix IV constituents from downgradient monitoring points in the Clarion aquifer collected through 2019 were compared to GWPSs. The statistical analyses for this comparison are included in the Manages 4.1 output files presented in Appendix H. The following SSLs greater than the GWPSs were identified in the Clarion aquifer:

App. IV Constituent	Location(s)	Comparison Value (mg/L)	GWPS (mg/L)
Lithium	MW-13A	Lower Confidence Limit 0.34	0.30

7.7 SUMMARY OF SSLs

As discussed in Sections 7.1 through 7.6, SSLs of arsenic and lithium greater than GWPSs have been identified in groundwater at LBR as summarized in the following table:

App. IV Constituent	Location(s)	Aquifer
Arsenic	MW-16A	Lower Glenshaw
	S-17	
Lithium	S-19E	Middle Glenshaw
	MW-9BR	Lower Glenshaw
	MW-16A	
	MW-12B	
	MW-17A	
	S-17	
	S-19F	
	S-4PA	Freeport
	S-85	
	S-16D	Worthington
	S-81	
	S-84	
	MW-13A	Clarion

Monitoring locations with SSLs of arsenic or lithium greater than their respective GWPS are located on FirstEnergy property downgradient of the LBR pool (Drawing 4). With the exception of MW-13A that monitors the Clarion aquifer, SSLs are confined to the shallow aquifers at LBR

that are in contact with the CCR (Middle Glenshaw, Lower Glenshaw, Freeport and Worthington). In the portion of the facility where SSLs occur, the Middle Glenshaw, Lower Glenshaw, Freeport and Worthington aquifers crop out on FirstEnergy property and, therefore, groundwater containing SSLs of arsenic and lithium greater than the GWPS cannot extend beyond the FirstEnergy property boundary as the aquifers have been removed by erosion. In the deeper Clarion aquifer where an SSL for lithium was identified at MW-13A, downgradient monitoring points MW-15B and MW-23B are in compliance with the lithium GWPS. As such, SSLs for arsenic and lithium are confined to FirstEnergy property and there are no groundwater users within the area.

For arsenic, the GWPS under the CCR Rule and the groundwater abatement standard under LBR's Permit both equal the MCL; therefore, the same standard applies for arsenic under both the CCR Rule and Pennsylvania regulations. The GWPS for lithium under the CCR Rule is the alternative risk-based GWPS (i.e. RSL) or background at LBR, whichever is greater. Pennsylvania has published non-residential Statewide Health Standards (SHSs) for lithium in groundwater (0.23 mg/L in used aquifers with ≤ 2,500 mg/L TDS and 23 mg/L in used aquifers with > 2,500 mg/L TDS) that are risk-based standards calculated by the PADEP to be protective of human health and the environment under reasonable non-residential exposure assumptions and factors. Accordingly, for the Clarion aquifer the non-residential SHS is 23 mg/L. For all the remaining aquifers the non-residential SHS is 0.23 mg/L. Out of the 13 locations containing lithium concentrations greater than the GWPS, 10 locations contain lithium at concentrations that are less than the Pennsylvania risk-based SHS as shown on Drawing 4.

The results of assessment monitoring in 2019 show that groundwater conditions at LBR are generally consistent with what was characterized in 2018 and reported in the June 12, 2019 Assessment of Corrective Measures Report, with no major recent changes identified as it pertains to SSLs. Groundwater quality surrounding the site has been improving since the cessation of disposal and commencement of facility closure (i.e. capping) in 2017. Further improvements are anticipated both during and after completion of facility closure.

8.0 ACTIVITIES FOR 2020 CALENDAR YEAR

Anticipated activities for the upcoming calendar year include the following:

- Continue monitoring in accordance with the Assessment Monitoring program.
- Within 30 days of placing this Annual Groundwater Monitoring and Corrective Action Report in the facility's operating record, the report will be posted on the facility's publicly accessible internet site and notification will be provided to the State Director that the report is available.
- As presented in the June 2019 Assessment of Corrective Measures Report, the abatement approach selected in accordance with the Permit (closure/capping and monitored attenuation) is also the preferred corrective measure to comply with 40 CFR §257.96. Pending PADEP's approval of the Groundwater Abatement Plan submitted to satisfy the facility's Permit, a remedy will be selected pursuant to 40 CFR § 257.97.

APPENDIX A

ACM DEMONSTRATION FOR 60-DAY EXTENSION

COAL COMBUSTION RESIDUALS RULE
ASSESSMENT OF CORRECTIVE MEASURES
DEMONSTRATION FOR 60-DAY EXTENSION

FirstEnergy Generation, LLC
Little Blue Run Disposal Facility
Greene Township, Beaver County, PA / Grant District, Hancock County, WV
April 15, 2019

DEMONSTRATION

To satisfy 40 CFR § 257.95(g)(1), FirstEnergy Generation, LLC is currently in the process of characterizing the nature and extent of two constituents including arsenic and lithium that have been detected at statistically significant levels above groundwater protection standards at the Little Blue Run Disposal Facility ("Little Blue Run"). As allowed under 40 CFR § 257.96(a), an additional 60 days is required to collect a sufficient amount of data to support an accurate assessment of corrective measures. As a result, the Assessment of Corrective Measures Report for Little Blue Run will now be completed by June 14, 2019 instead of April 15, 2019.

CERTIFICATION

We hereby certify to the best of knowledge, information, and belief that the above demonstration meets the requirements of 40 CFR § 257.96(a).

Background Data Information

Start	End	Count	Percent ND	Normal/ Lognormal
Run Id: 54	Parameter: Lithium, total mg/L			
01/01/2016	01/01/2018	14	0.00	Y / Y
Background-based GWPS higher than limit-based GWPS.				
Run Id: 55	Parameter: Mo, tot mg/L			
---	---	---	---	---
Run Id: 56	Parameter: Pb, tot mg/L			
---	---	---	---	---
Run Id: 57	Parameter: Ra-226,228, tot pCi/L			
01/01/2016	01/01/2018	14	7.14	Y / N
Background-based GWPS higher than limit-based GWPS.				
Run Id: 58	Parameter: Sb, tot mg/L			
---	---	---	---	---
Run Id: 59	Parameter: Se, tot mg/L			
---	---	---	---	---
Run Id: 60	Parameter: Tl, tot mg/L			
---	---	---	---	---

Compliance Data Information

Start	End	Count	Percent ND	Trend	Normal/ Lognormal	GWPS Basis	Comparison Test	Compare To	Comparison Value	GWPS	SSL
01/01/2016	11/04/2019	13	0	None	N / Y	PARA TI	CI-Log	LCL	0.0097	0.30	NO
01/01/2016	11/04/2019	14	43	None	N / Y	MCL	CI-Log	LCL	0.00031	0.10	NO
01/01/2016	11/04/2019	14	14	Downward	Y / Y	MCL	CB-TheilSen	LCB	-.0017	0.015	NO
Normality test of residuals failed, switched to Theil-Sen											
01/01/2016	11/04/2019	13	23	None	Y / Y	PARA TI	CI-Nrml Mean	LCL	0.41	100.	NO
01/01/2016	11/04/2019	14	86	None	N / N	MCL	CI-NPAR	LCL	0.000088	0.0060	NO
01/01/2016	11/04/2019	14	71	None	N / Y	MCL	CI-NPAR	LCL	0.00041	0.050	NO
01/01/2016	11/04/2019	14	100	None	N / N	MCL	100%ND	LCL	0.0	0.0020	NO
Confidence interval not calculated because all compliance data are non-detect.											

Little Blue Run

Background Data Information

Start	End	Count	Percent ND	Normal/ Lognormal

Compliance Data Information

Start	End	Count	Percent ND	Trend	Normal/ Lognormal	GWPS Basis	Comparison Test	Compare To	Comparison Value	GWPS	SSL

UCL - Upper Confidence Level Value
UCB - Upper Confidence Band Value at Last Sample Date
LCL - Lower Confidence Level Value
LCB - Lower Confidence Band Value at Last Sample Date
Mean - Compliance Data Mean
Median - Compliance Data Median
Each - When background is based on Last, Median, Minimum Detection Limit
PARA TI - Parametric Tolerance Interval
NPARA TI - Non Parametric Tolerance Interval
CI-Nrml - Confidence Interval around Normal Mean
CI-Log - Confidence Interval around Log Normal Mean
CI-NPARA - Non Parametric Confidence Interval around Median
CB-LinReg - Confidence Band around Linear Regression
CB-TheilSen - Confidence Band around Theil-Sen line
